

LEVEL 5

Level 5: Focusing on the important class

Now you have a classifier that can recognize all things a bee might want to communicate. But you are not quite happy with it yet. Until now you have treated all classes the same, but you would like to make sure that your classifier is especially accurate at recognizing when a bee is trying to warn its friends about potential **Danger**.

To pass this level your classifier needs to achieve a recall of 80% and a precision of 80% for the **Danger** class (class 0) on the **full test data**. Also, the overall accuracy must be at least 50 %.

The output format is the same as before.
