Level 4: Recognising all classes

You have trained you first classifier, great!

Now you need to improve your classifier so that it can recognize all the classes. Therefore, you should train on all the training data, except the invalid samples.

To pass this level your classifier should achieve an accuracy of at least 60% on the **full test data**.

The output format is the same as before, except now every line must contain a digit between 0 and 4.

Example:

```
0
3
2
1
0
```
